IMMUNE SYSTEM

The immune system consists of organs that fight the body's invaders and it consists of lymph vessels, lymph nodes, and specialized lymphatic organs that patrol all over the body. From lymph capillaries, the smallest vessels, cells called T-lymphocytes are produced and travel through the lymph system. These cells are produced in the bone marrow and travel through the lymph system to fight infection.

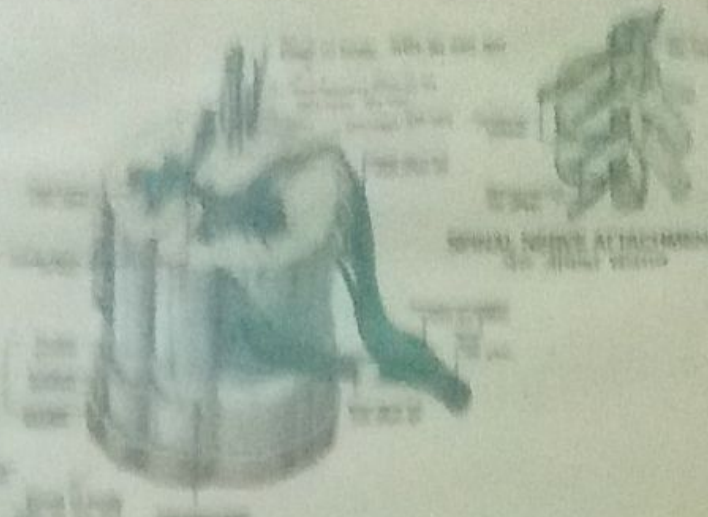

When an infection occurs, specialized white blood cells, called lymphocytes, are produced in the bone marrow. They travel through the lymph system to fight infection. Lymph vessels form a network of tubes. Lymph flows into larger vessels called lymphatics, which are studied in the lymphatic system. When an infection occurs, specialized white blood cells

SKELLETAL SYSTEM

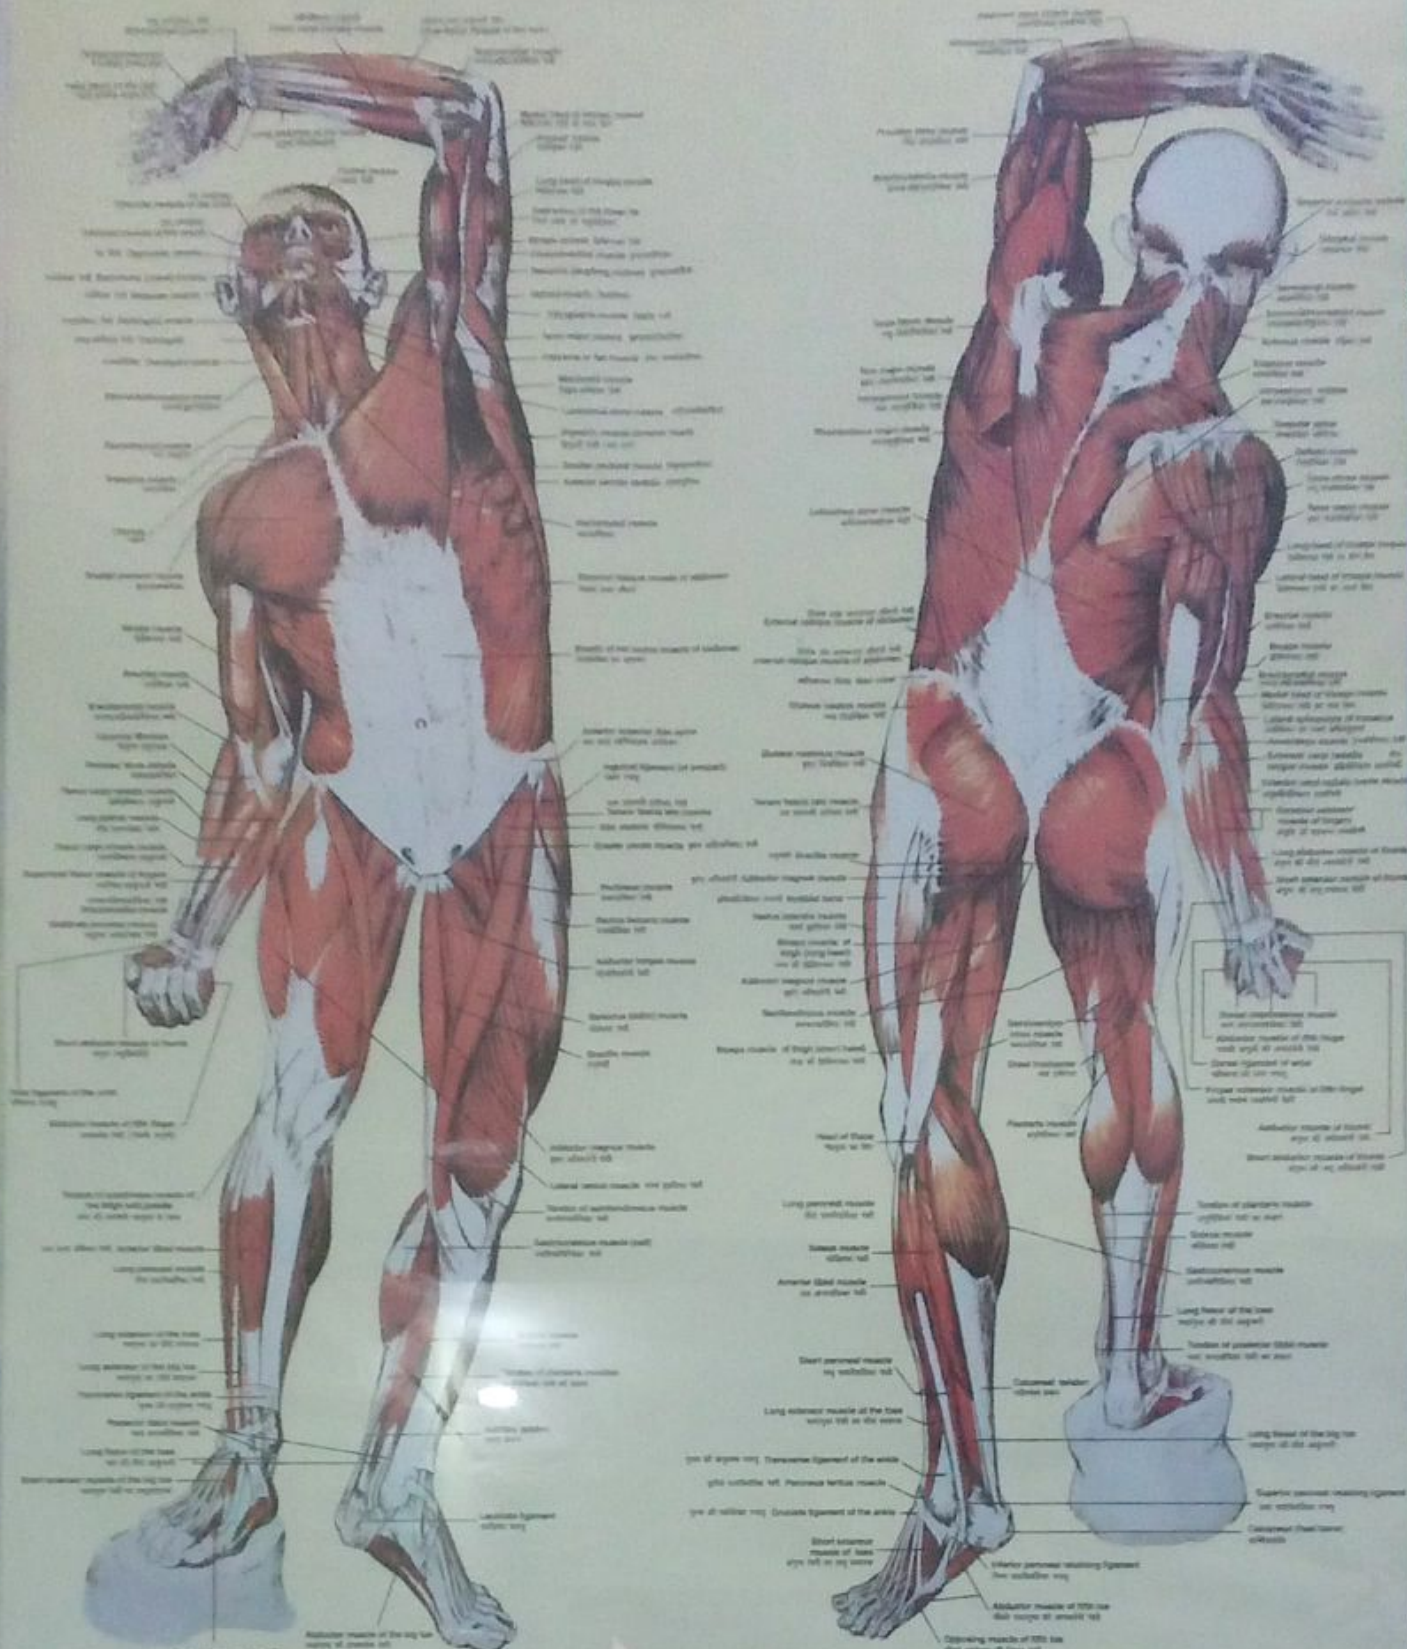

The human skeleton supports the body, protects the internal organs, and provides anchorage for the muscles. It consists of bones and connective tissue called cartilage. Although an individual's body is around five times stronger than a steel bar of similar weight, the many joints in a skeleton allow a wide range of movement. The human skeleton contains 206 bones, about half of which are in the hands and feet and consists of two main groups: the axial skeleton (skull, vertebral column, and ribcage) and the appendicular skeleton (the bones of the arms and legs). To allow for childbirth, the female pelvic cavity is shallower and wider than the male cavity.
